	julia	python	R
| **System** | ```julia
pwd() # print working directory
cd("/Users/sswatson") # change directory
readdir() # files and folders in current directory
``` | ```python
import os
os.getcwd()
os.chdir("/Users/sswatson")
os.listdir()
``` | ```r
getwd()
setwd("/Users/sswatson/")
dir()
``` |
| **Packages** | ```julia
using Pkg; Pkg.add("Plots")
using Plots
``` | ```python
import numpy as np
import matplotlib.pyplot as plt
from sympy import *
``` | ```r
install.packages('ggplot2')
library(ggplot2)
``` |
| **Arithmetic** | ```julia
x = (1 + 2^3) % 4
x == 1 # returns true
``` | ```python
x = (1 + 2**3) % 4
x == 1
``` | ```r
x <- (1 + 2^3) %% 4
x == 1
``` |
| **Strings** | ```julia
length("Hello World") # string length
"Hello" * "World" # concatenation
join(["Hello", "World"], ",") # joining
split("Hello, World", ",") # splitting
'H' # single-quotes are for characters, not strings
``` | ```python
len('Hello world')
'Hello' + 'World'
','.join(['Hello', 'World'])
'Hello, World'.split(',')
"Hello, World" # alternate string syntax
``` | ```r
nchar('Hello World')
paste('Hello', 'World')
paste(c('Hello', 'World'), collapse='')
strsplit('Hello, World', ',')
"Hello, World" # alternate string syntax
``` |
| **Booleans** | ```julia
true && false == true  # and
false || true == true  # or
!true == false  # not
``` | ```python
True and False == False
False or True == True
not True == False
``` | ```r
TRUE && FALSE == FALSE
FALSE || TRUE == TRUE
!TRUE == FALSE
``` |
| **Loops** | ```julia
for i in 1:10
    print(i)
end

while x > 0
    x -= 1
end
``` | ```python
for i in range(10):
    print(i)

while x > 0:
    x -= 1
``` | ```r
for (i in 1:10) {
    print(i)
}

while (x > 0) {
    x = x - 1
}
``` |
| **Conditionals** | ```julia
if x > 0
    print("x is positive")
elseif x == 0
    print("x is zero")
else
    print("x is negative")
end

# ternary conditional
x > 0 ? 1 : -1
``` | ```python
if x > 0:
    print('x is positive')
elif x == 0:
    print('x is zero')
else:
    print('x is negative')

1 if x > 0 else -1
``` | ```r
if (x > 0) {
    print('x is positive')
}
else if (x == 0) {
    print('x is zero')
}
else {
    print('x is negative')
}

ifelse(x>0, 1, -1)
``` |
| **Functions** | ```julia
function f(x,y)
    x² = x * x # \^2[tab] gives the unicode superscript
    x² + sqrt(y*x²+1)
end # -or-
f(x) = x^2 + sqrt(y*x^2 + 1) # -or- (anonymous)
x -> x^2 + sqrt(y*x^2 + 1)
``` | ```python
def f(x,y):
    x2 = x * x
    return x2 + (y*x2+1)**(1/2)
# -or-
lambda x: x**2 + (y*x**2+1)**(1/2)
``` | ```r
f <- function(x,y) {
    x2 <- x * x
    x2 + sqrt(y*x2+1)
}
``` |
| **Splatting** | ```julia
args = [1,2]
kwargs = (tol=0.1, maxiter=100) # a NamedTuple
f(args...;kwargs...) # equiv. to f(1, 2; tol=0.1, maxiter=100)
``` | ```python
args = [1,2]
kwargs = {'tol':0.1, 'maxiter':100} # a dictionary
f(*args, **kwargs) # equiv. to f(1, 2, tol=0.1)
``` | ```r
library(plyr)
splat(f)(c(1,2)) # equiv. to f(1,2)
``` |
| **Lists** | ```julia
myArray = [1, 2, "a", [10,8,9]]
myArray[3] == "a"
myArray[4][2] == 8
myArray[end] == [10, 8, 9]
2 in myArray
``` | ```python
myList = [1, 2, "a", [10,8,9]]
myList[2] == "a"
myList[3][2] == 9
myList[-1] == [10, 8, 9]
2 in myList
``` | ```r
myList <- list(1, 2, "a", list(10,8,9))
myList[3] == "a"
myList[4][2] == 8
myList[length(myList)] # returns list(10,8,9)
2 %in% myList
``` |

A Julia-Python-R reference sheet

	julia	**python**	**R**

Mapping and filtering

Julia:
```julia
# list the subtotals for items with quantity less than 4
fruits = ["apples", "oranges", "pears"]
prices = [1.60, 1.15, 0.85]
quantities = [1, 4, 3]
[(f, p*q) for (f,p,q) in zip(fruits, prices, quantities) if q < 4]
```

python:
```python
# exactly the same as the Julia code
fruits = ["apples", "oranges", "pears"]
prices = [1.60, 1.15, 0.85]
quantities = [1, 4, 3]
[(f, p*q) for (f,p,q) in zip(fruits, prices, quantities) if q < 4]
```

R:
```r
# we use Map to replicate Julia and Python's list comprehension with zip
fruits <- c("apples", "oranges", "pears")
prices <- c(1.60, 1.15, 0.85)
quantities <- c(1, 4, 3)
Map(function(f,p,q) list(f,p*q), fruits, prices, quantities)[quantities<4]
```

Ranges

Julia:
```julia
range(0, 2π, step=0.1) # or 0:0.1:2π
range(0, 2π, length=100) # or LinRange(0,2π,100)
collect(0:5) == [0,1,2,3,4,5] # collect a range to get a vector
```

python:
```python
np.arange(0, 2*np.pi, step=0.1)
np.linspace(0, 2*np.pi, num=100)
list(range(5)) == [0,1,2,3,4]
```

R:
```r
seq(0, 2*pi, by=0.1)
seq(0, 2*pi, length=100)
0:5 == c(0,1,2,3,4,5)
```

Vectors and matrices

Julia:
```julia
A = [1 2; 3 4] # matrix with rows [1 2] and [3 4]
b = [1, 2] # (column) vector
A' # transpose
size(A) # matrix dimension: (2, 2)
A \ b # solve the equation Ax = b
b .> 0 # elementwise comparison
A.^2 # elementwise product
A * A # matrix product
findall(x -> x>0, b) # indices of positive values
fill(2, (10,10)) # 10 x 10 matrix of 2's
I # multiplicative identity
hcat(A, b') # (or [A b']) concatenate side-by-side
vcat(A, b) # (or [A;b']) concatenate vertically
```

python:
```python
A = np.array([[1, 2], [3, 4]])
b = np.array([1, 2])
np.transpose(A) # or A.T
A.shape
np.linalg.solve(A, b)
b > 0 # elementwise comparison
b**2 # elementwise function application
A @ A # matrix product
np.where(b > 0)
np.full((10,10), 2)
np.eye(4) # 4 x 4 identity matrix
np.hstack((A,b[:,np.newaxis]))
np.vstack((A,b))
```

R:
```r
A <- matrix(c(1,3,2,4),nrow=2) # column-wise!
b <- c(1,2)
t(A)
dim(A)
solve(A,b)
b > 0 # elementwise comparison
A^2 # elementwise product
A %*% A # matrix product
which(b > 0)
matrix(rep(2,100), nrow=10)
diag(4)
cbind(A,b)
rbind(A,b)
```

Slicing

Julia:
```julia
A = rand(10,10)
A[1:5,1:2:end] # first five rows, odd-indexed columns
```

python:
```python
A = np.random.rand(10,10)
A[:5,1::2]
```

R:
```r
A <- matrix(runif(100), nrow=10)
A[1:5, seq(1,10,by=2)]
```

Random numbers

Julia:
```julia
using Random; Random.seed!(1234)
rand(10,10) # matrix with Unif[0,1]'s
randn(10) # vector with N(0,1)'s
rand(10:99) # random two-digit number
```

python:
```python
np.random.seed(1234)
np.random.rand(10,10)
np.random.randn(10)
np.random.randint(10,100)
```

R:
```r
set.seed(1234)
matrix(runif(100),nrow=10)
rnorm(10)
sample(10:99,1)
```

Data frames

Julia:
```julia
using DataFrames, FileIO
myDataFrame = DataFrame(load("data.csv"))
save("mydata.csv", myDataFrame)

# Language-integrated query
using DataFramesMeta, RCall # get nycflights13 data from R
flights = rcopy(R"nycflights13::flights")
@linq flights |>
    where(:month .== 1, :day .< 5) |> # filter rows
    orderby(:day, :distance) |> # sort rows
    select(:month, :day, :distance, :air_time) |> # select columns
    transform(speed = :distance ./ :air_time * 60) |> # new columns
    by(:day, avgspeed = mean(skipmissing(:speed))) # split-apply-combine
```

python:
```python
import pandas as pd
myDataFrame = pd.read_csv("data.csv")
myDataFrame.to_csv("mydata.csv")

from rpy2.robjects import r, pandas2ri
from rpy2.robjects.packages import importr
importr('nycflights13'); flights = pandas2ri.ri2py(r['flights'])
flights.query('month == 1 & day < 5') \
    .sort_values(['day', 'distance']) \
    [['month', 'day', 'distance', 'air_time']] \
    .assign(speed = flights.distance/flights.air_time * 60) \
    .groupby('day') \
    .agg({'speed':'mean'})
```

R:
```r
myDataFrame <- read.csv("data.csv")
write.csv(myDataFrame, "mydata.csv")

library(dplyr); library(nycflights13)
flights %>%
    filter(month == 1, day < 5) %>%
    arrange(day, distance) %>%
    select(month, day, distance, air_time) %>%
    mutate(speed = distance / air_time * 60) %>%
    group_by(day) %>%
    summarise(avgspeed = mean(speed, na.rm=TRUE))
```

Plotting

Julia:
```julia
using StatsPlots
# select the rows with an air_time value and plot a histogram
histogram(filter(!ismissing, flights[:air_time]))
# scatter plot (using the first 10,000 records)
flights[1:10^4,:] |>
    @df scatter(:air_time, :distance, group=:carrier)
```

python:
```python
import seaborn as sns
# histogram
sns.distplot(flights['air_time'].dropna())
# scatter plot
sns.pairplot(flights, x_vars='air_time', y_vars='distance', hue='carrier',
             plot_kws={'alpha': 0.2})
```

R:
```r
library(ggplot2)
# aesthetic mapping: connects data to visual elements (x, y, size, color)
# geom: geometric object used to represent data (point, line, bar)
# geom functions return layers that you add to a ggplot
ggplot(data = flights) +
    geom_point(mapping=aes(x=air_time,y=distance,color=carrier),alpha=0.2)
```

Optimization

Julia:
```julia
using Optim
rosenbrock(x) = (1.0 - x[1])^2 + 100.0 * (x[2] - x[1]^2)^2
result = optimize(rosenbrock, zeros(2), BFGS())
```

python:
```python
from scipy.optimize import minimize
def rosenbrock(x):
    return (1-x[0])**2 +100*(x[1]-x[0]**2)**2
minimize(rosenbrock, [0,0], method='BFGS')
```

R:
```r
rosenbrock <- function(x) {
    (1-x[1])^2 +100*(x[2]-x[1]^2)^2
}
optim(c(0,0), rosenbrock, method = "BFGS")
```

Root finding

Julia:
```julia
using Roots
f(x) = exp(x) - x^4
find_zero(f,3)
```

python:
```python
import numpy as np
from scipy.optimize import root
def f(x):
    return np.exp(x[0]) - x[0]**4
root(f, [0])
```

R:
```r
f <- function(x) {
    exp(x) - x^4
}
uniroot(f,c(0,3))
```
